

## Software Block Diagram

## A More In-Depth Explanation of the Algorithms blocks

MAX() returns an int of value 5  
MIN() returns an int of value 6

MEAN then calculates the average value using the datas' extrema

$$\frac{\text{Data}[5] + \text{data}[6]}{2}$$

VAR then calculates the variance using the datas' extrema and calculated MEAN

$$\frac{(\text{Data}[5] - \text{MEAN})^2 + (\text{data}[6] - \text{MEAN})^2}{2}$$

The Algorithm checks to see if the max came before or after the min. You can determine the movement of the sensor by Applying this in 3-dimensions
